

Relational Calculus

CS 186, Fall 2002, Lecture 8
R&G, Chapter 4

We will occasionally use this arrow notation unless there is danger of no confusion.

Ronald Graham
Elements of Ramsey Theory

Relational Calculus

- Comes in two flavors: **Tuple relational calculus (TRC)** and **Domain relational calculus (DRC)**.
- Calculus has **variables, constants, comparison ops, logical connectives and quantifiers**.
 - **TRC**: Variables range over (i.e., get bound to) *tuples*.
 - Like SQL.
 - **DRC**: Variables range over *domain elements* (= field values).
 - Like Query-By-Example (QBE)
 - Both TRC and DRC are simple subsets of first-order logic.
 - We'll focus on TRC here
- Expressions in the calculus are called **formulas**.
- Answer tuple is an assignment of constants to variables that make the formula evaluate to **true**.

Tuple Relational Calculus

- **Query** has the form: $\{T \mid p(T)\}$
 - $p(T)$ denotes a formula in which tuple variable T appears.
- **Answer** is the set of all tuples T for which the formula $p(T)$ evaluates to true.
- **Formula** is recursively defined:
 - ❖ start with simple *atomic formulas* (get tuples from relations or make comparisons of values)
 - ❖ build bigger and better formulas using the *logical connectives*.

TRC Formulas

- An **Atomic formula** is one of the following:
 - $R \sqsubseteq Rel$
 - $R.a \text{ op } S.b$
 - $R.a \text{ op } constant$ op is one of $<, >, =, \sqsubseteq, \geq, \neq$
- A **formula** can be:
 - an atomic formula
 - $\sqcup p, p \sqcup q, p \quad q$ where p and q are formulas
 - $\sqcup R(p(R))$ where variable R is a tuple variable
 - $\sqcup R(p(R))$ where variable R is a tuple variable

Free and Bound Variables

- The use of **quantifiers** $\sqcup X$ and $\sqcup X$ in a formula is said to **bind** X in the formula.
 - A variable that is **not bound** is **free**.
- Let us revisit the definition of a **query**:
 - $\{T \mid p(T)\}$
- There is an important restriction
 - the variable T that appears to the left of \mid must be the **only** free variable in the formula $p(T)$.
 - in other words, all other tuple variables must be bound using a quantifier.

Selection and Projection

- Find all sailors with rating above 7
 - $\{S \mid S \sqsubseteq Sailors \sqcup S.rating > 7\}$
 - Modify this query to answer: Find sailors who are older than 18 or have a rating under 9, and are called 'Bob'.
- Find names and ages of sailors with rating above 7.
 - $\{S \mid \sqcup S1 \sqsubseteq Sailors(S1.rating > 7 \sqcup S.sname = S1.sname \sqcup S.age = S1.age)\}$
 - Note: S is a tuple variable of 2 fields (i.e. $\{S\}$ is a projection of *Sailors*)
 - only 2 fields are ever mentioned and S is never used to range over any relations in the query.

Joins

Find sailors rated > 7 who've reserved boat #103

```
{S | S ∈ Sailors ∧ S.rating > 7 ∧
  ∃R(R ∈ Reserves ∧ R.sid = S.sid
    ∧ R.bid = 103)}
```

Note the use of \exists to find a tuple in Reserves that `joins with' the Sailors tuple under consideration.

Joins (continued)

```
{S | S ∈ Sailors ∧ S.rating > 7 ∧
  ∃R(R ∈ Reserves ∧ R.sid = S.sid
    ∧ ∃B(B ∈ Boats ∧ B.bid = R.bid
      ∧ B.color = 'red'))}
```

Find sailors rated > 7 who've reserved a red boat

- Observe how the parentheses control the scope of each quantifier's binding.
- This may look cumbersome, but it's not so different from SQL!

Division (makes more sense here???)

Find sailors who've reserved all boats
(*hint, use \forall*)

```
{S | S ∈ Sailors ∧
  ∃B(B ∈ Boats (∃R(R ∈ Reserves
    (S.sid = R.sid
    ∧ B.bid = R.bid)))}
```

- Find all sailors S such that for all tuples B in Boats there is a tuple in Reserves showing that sailor S has reserved B .

Division – a trickier example...

Find sailors who've reserved all Red boats

```
{S | S ∈ Sailors ∧
  ∃B(B ∈ Boats ( B.color = 'red' ∧
  ∃R(R ∈ Reserves ∧ S.sid = R.sid
    ∧ B.bid = R.bid))}
```

Alternatively...

```
{S | S ∈ Sailors ∧
  ∃B(B ∈ Boats ( B.color = 'red'
  ∃R(R ∈ Reserves ∧ S.sid = R.sid
    ∧ B.bid = R.bid))}
```

$a \supset b$ is the same as $\neg a \vee b$

	b	
	T	F
a	T	F
F	T	T

- If a is true, b must be true!
 - If a is true and b is false, the implication evaluates to false.
- If a is not true, we don't care about b
 - The expression is always true.

Unsafe Queries, Expressive Power

- \exists syntactically correct calculus queries that have an infinite number of answers! Unsafe queries.
 - e.g., $\{\{S \mid S \in Sailors\}\}$
 - Solution???? Don't do that!
- Expressive Power (Theorem due to Codd):
 - every query that can be expressed in relational algebra can be expressed as a *safe* query in DRC / TRC; the converse is also true.
- Relational Completeness: Query language (e.g., SQL) can express every query that is expressible in relational algebra/calculus. (actually, SQL is more powerful, as we will see...)

Summary

- **The relational model has rigorously defined query languages — simple and powerful.**
- **Relational algebra is more operational**
 - useful as internal representation for query evaluation plans.
- **Relational calculus is non-operational**
 - users define queries in terms of what they want, not in terms of how to compute it. (*Declarative*)
- **Several ways of expressing a given query**
 - a *query optimizer* should choose the most efficient version.
- **Algebra and safe calculus have same *expressive power***
 - leads to the notion of *relational completeness*.

Addendum: Use of \forall

- $\forall x (P(x))$ - is only true if $P(x)$ is true for *every* x in the universe
- Usually:
 - $\forall x ((x \in \text{Boats}) \rightarrow (x.\text{color} = \text{"Red"}))$
- \rightarrow logical implication,
 - $a \rightarrow b$ means that if a is true, b must be true
 - $a \rightarrow b$ is the same as $\neg a \vee b$

Find sailors who've reserved all boats

$\{S \mid S \in \text{Sailors} \wedge$
 $\neg \exists B (B \in \text{Boats} \wedge$
 $\neg \exists R (R \in \text{Reserves} \wedge S.\text{sid} = R.\text{sid}$
 $\wedge B.\text{bid} = R.\text{bid}))\}$

- **Find all sailors S such that for each tuple B either it is not a tuple in Boats or there is a tuple in Reserves showing that sailor S has reserved it.**

$\{S \mid S \in \text{Sailors} \wedge$
 $\neg \exists B (\neg (B \in \text{Boats}) \wedge$
 $\neg \exists R (R \in \text{Reserves} \wedge S.\text{sid} = R.\text{sid}$
 $\wedge B.\text{bid} = R.\text{bid}))\}$

... reserved all red boats

$\{S \mid S \in \text{Sailors} \wedge$
 $\neg \exists B (B \in \text{Boats} \wedge B.\text{color} = \text{"red"} \wedge$
 $\neg \exists R (R \in \text{Reserves} \wedge S.\text{sid} = R.\text{sid}$
 $\wedge B.\text{bid} = R.\text{bid}))\}$

- **Find all sailors S such that for each tuple B either it is not a tuple in Boats or there is a tuple in Reserves showing that sailor S has reserved it.**

$\{S \mid S \in \text{Sailors} \wedge$
 $\neg \exists B (\neg (B \in \text{Boats}) \vee (B.\text{color} \neq \text{"red"})$
 $\wedge \neg \exists R (R \in \text{Reserves} \wedge S.\text{sid} = R.\text{sid}$
 $\wedge B.\text{bid} = R.\text{bid}))\}$
